Office Action Summary	Examiner	Art Unit					
	Benjamin Packard	1612					
The MAILING DATE of this communication app Period for Reply	ears on the cover sheet with the c	orrespondence address					
A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.  - Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.  - If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.  - Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

#### **DETAILED ACTION**

### Response to Election/Restriction

Applicant's election of Group I, claims 1-12, in the reply filed on 3/1/2010 is acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the restriction requirement, the election has been treated as an election without traverse (MPEP § 818.03(a)).

Claims 13-16 are withdrawn from further consideration pursuant to 37 CFR 1.142(b), as being drawn to a nonelected invention, there being no allowable generic or linking claim.

Applicant's election of stearic acid as the aliphatic monocarboxylic acid and propionic acid as the preservative in the reply filed on 3/1/2010 is also acknowledged. Because applicant did not distinctly and specifically point out the supposed errors in the species election, the election has been treated as an election without traverse (MPEP § 818.03(a)).

## Claim Rejections - 35 USC § 103

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

The factual inquiries set forth in *Graham* v. *John Deere Co.*, 383 U.S. 1, 148 USPQ 459 (1966), that are applied for establishing a background for determining obviousness under 35 U.S.C. 103(a) are summarized as follows:

- 1. Determining the scope and contents of the prior art.
- 2. Ascertaining the differences between the prior art and the claims at issue.
- 3. Resolving the level of ordinary skill in the pertinent art.
- 4. Considering objective evidence present in the application indicating obviousness or nonobviousness.

This application currently names joint inventors. In considering patentability of the claims under 35 U.S.C. 103(a), the examiner presumes that the subject matter of the various claims was commonly owned at the time any inventions covered therein were made absent any evidence to the contrary.

Claims 1-12 are rejected under 35 U.S.C. 103(a) as being unpatentable over Kitamura et al (US 5,676,966) in view of Bischoff et al (US 4,770,876).

Kitamura et al teaches coating a biologically active substance with a coating composition comprising 65-90% a hydrophobic protecting substance, 2-10% a surface active agent, and talc powder (col 2 lines 47-59). Illustrative biological active substances include lysine hydrochloride (col 3 lines 1-5 and Example 1 at col 6 lines 51-65). The hydrophobic protecting substance includes lecithin and stearic acid (col 4 lines 5-17 and coating of Example 1 at col 6 line 66 spanning col 7 line 8). The resulting formulations preferably have a diameter from about 1 to 5 mm (col 5 lines 46-50). Where the core is 100 parts by weight containing the biological active, the coating is then taught to be 10-100 parts by weight (col 5 lines 33-41).

Kitamura et al does not teach the addition of propionic acid.

Application/Control Number: 10/588,969 Page 4

Art Unit: 1612

Bischoff et al teaches the use of propionic acid as a preservative for livestock compositions (col 8 lines 53-56) where other suitable components include lecithin (col 8 lines 51-52) and amino acids (col 4 lines 6-11).

Bischoff et al does not teach the addition of the preservative in the coating.

It would have been obvious to one of ordinary skill in the art to select the lysine hydrochloride as the active coated with lecithin and stearic acid from the primary reference based on the explicit teaching that the components are suitable together and guided by the working examples.

Further, it would have been obvious to the skilled artisan to include a preservative to in the coating and the core which is known to be compatible not only for the intended use of the composition, but also compatible with the components present in the composition. The amount of the preservative would be a function of the components present and routine optimization would be used to determine the optimum amount in order to provide preservation of the active and the components of the coating. See MPEP 2144.05.

Finally, with regards to instant claim 11, where the shape is not specifically defined in the prior art but size is measured by diameter, it is reasonably expected that the resulting granules are of a sphere like shape.

## Conclusion

No claims allowed.

Application/Control Number: 10/588,969 Page 5
